

LOCAL DATA ANALYSIS OF SYSTEM LOGS

Setup

Make a new branch with task name and your git nickname

Goal: Extract, process, and visualize data from local log files (Linux/Windows).

Tasks

- Set up Python + libraries (pandas, matplotlib).
- Identify relevant log files (e.g., /var/log/syslog, auth.log, Event Viewer logs).
- Create script to parse logs and extract key information.
- Generate visualizations: frequency of errors, user login times, resource spikes(bar charts, time series, pie charts) with Matplotlib or Seaborn.
- Export results to PDF or HTML.
- Automate the script to generate weekly log analysis.

Submit: GitHub repo with code + screenshots of visualizations + short explanation document.

Estimated time 2 weeks
