

SECURE LOCAL API CONFIGURATION

Setup

Make a new branch with task name and your git nickname

Goal: Build a REST API with secure authentication and logging.

Tasks

- Define CRUD operations for a simple resource (e.g., users, projects, devices).
- Create REST API using Flask (Python) or Express (Node.js).
- Implement token-based authentication (e.g., JWT).
- Use self-signed certificates for HTTPS (localhost only).
- Log all incoming requests, IPs, timestamps, and errors.
- Simulate user role-based access (admin/user) with token permissions.
- Add a logging dashboard or endpoint to retrieve recent logs.

Submit: README(write documentation for API usage and security setup.), screenshots from

Postman or curl + logs.

Estimated time 2 weeks
